

PP3S Diary 5

Group E

May 2026

This week Tekle and I coded the portfolio module. It includes a sell/buy function for the stock transactions. Combined with that we created functions to get the portfolio/holdings of a specific user. This will be the connection from the portfolio module to the leadership module where we want to compare the users net worth. (Ella)

We prepared for the presentation regarding the technologies we used and the possible questions we would have to answer. We also went over the overall progress we had made over the past few weeks, as well as the general structure of the project so far. (Doruk and Mehmet)

To prepare for the upcoming presentation, I reviewed the project's development and considered possible questions that could be asked. I also looked through the contributions made by different team members and consolidated my understanding of the overall project progress. (Yifan)

This week I worked together with the Project Manager on the project presentation. We discussed the overall structure of the presentation and organized the content into clear sections. We reviewed the key points that need to be presented and ensured that the information is arranged in a logical and understandable way. (Tekle)

In week 5, I wired the final midterm backend code from Moritz with the frontend. I wrapped each of the API modules into a Hono RPC client and to directly bind the type-safe functions for API calling. Afterwards, I deployed the production docker compose to have a running demo and worked with the PM on the presentation. (David)

I continued on Ella's and Tekle's work for the User/Portfolio/Leaderboard module and implemented based on the new architectural change the Trade Service. Furthermore, I wrote a basic market simulation for development using Geometric Brownian Motion to test out the market evolution in a faster pacing.

That also includes the necessary api routes and database seeding. At last, I fixed lints and formatting errors and updated the dev tooling. (Moritz)

This week I coordinating our efforts toward the upcoming midterm presentation. After we identified the requirements our goals for the presentation we distributed the tasks. Tekkle and I created the presentation slides. Together with David I prepared for possible questions by diving deep into important parts of the codebase and on the other hand zooming out to improve my understanding of the big picture. We also practiced the presentation. (David A)

Because I was ill, I only developed the performance chart history on the frontend dashboard to sync with the current portfolio balance and stock values. (Oliver)
