

# PP3S Diary 8

Group E

June 2026

This week, I was mainly occupied with seminar work and other academic commitments, so I had limited time to contribute to major development tasks. However, I stayed involved in the project by reviewing the current backend implementation and considering possible future improvements. In particular, I explored ideas for extending the stock information functionality, such as adding additional market data and analytics to provide users with a more comprehensive view of a stock. I also reviewed the current database structure to evaluate whether it could support these potential enhancements and to identify any changes that might be required in the future. (Yifan)

Again this week I took a look over the frontend and tried to find some open tasks. For that I sat together with Doruk und David. Then we decided who takes which task and then worked on them. I ran over the mechanism for choosing a password because I thought there was something missing. Turned out there wasn't, so I had no more work to do. (Ella)

I spend my time working on a couple of frontend issues. Specifically, the possibility for the user to change their password or email address. This required an implementation that works without an email service, since that requires a domain. While a domain can be very cheap, it doesn't make sense to buy one for a university course. I have come up with a solution where a signed in user can change their password on the settings page by confirming the old password and setting a new one. The same applies to the email. If a user forgot the password, he can click the "forgot password" button on sign-up and change the password by verifying the email address he uses. While that would be of course a terrible idea for production, it will suffice for this university course. (Oliver)

Wir haben diese Woche einen deep dive in unsere architektur gemacht. Wir sind noch einmal die Anforderungen durchgegangen und haben dann überlegt, ob die aktuelle Architektur noch die richtige ist. Dafür haben wir uns zuerst unseren Architekturgraphen angeschaut und haben ihn mit der Implementierung verglichen. An einigen Stellen war der Graph veraltet, an anderen Stellen haben wir Fehler in unserer Implementierung festgestellt. Um das richtig zu bewerten haben sich Beteiligte aus allen Sub Gruppen zusammengesetzt. Unsere Ergeb-

nisse werden wir beim nächsten Meeting den anderen teilen. (David, David, Tekle, Mehmet, Doruk, Moritz)
